Subject: Updating SAP

Hi All,

I am in the process of updating the SAP for this Fall's sampling and have several questions and updates.

- 1) Ferrous and Ferric Iron. We will be using a Hach test kit to quantify ferrous iron for both total and dissolved fractions in the field and will analyze to total Fe at the lab. Ferric will be calculated.
- 2) Chester cites sampling at the mouth of Cement Creek at a station label of CC0001 and CC49. Any idea where CC0001 is located? I didn't see it listed on your website.
- 3) Bill, I recall you will be having Scott sample in Mineral Creek. Is this true and will you be sampling at M34?
- 4) Chester has a station that was "routinely" sampled called Animas River @KOA campground. Any idea where this is? I found a USGS document that sounds like it used to be located at Durango Riverside Resort and RV Park just below Bakers Bridge. Can anyone confirm that?

I appreciate your help on this.
